Title MDD Digital AC Servo Motors with Liquid Cooling

Type of documentation Project Planning Manual

Documenttype DOK-MOTOR*-MDD**LIQUID-PRJ1-EN-E1,44 • 10.96

Internal file reference
- Mappe 12
- MDDLI-PJ.pdf
- 209-0069-4380-00

Reference This electronic document is based on the hardcopy document with document desig.: 209-0069-4380-00 EN/03.95

Purpose of documentation This documentation serves to
- clarify technical data
- mechanically integrate the motor into the machine
- electrically integrate the motor into the machine
- outline all available options
- specify order details for the motor and connecting accessories

Table of Contents

1. Liquid-cooled MDD servo motors

Liquid-cooled digital AC servo motors are rapid-response servo drives when used with digital intelligent drives. They are especially well-suited for use in tooling, textile, printing and packaging machines, as well as robotics, handling and transfer facilities.

Digital AC servo motors permit highest contouring accuracy with high feedrates, especially for cutting in high speed range.

The AC servo motors

- MDD 093 and
- MDD 115

are used, in particular, for high-dynamic applications.

The AC servo motors

- MDD 090 and
- MDD 112

are especially well-suited for high-precision applications requiring extreme synchroneity.

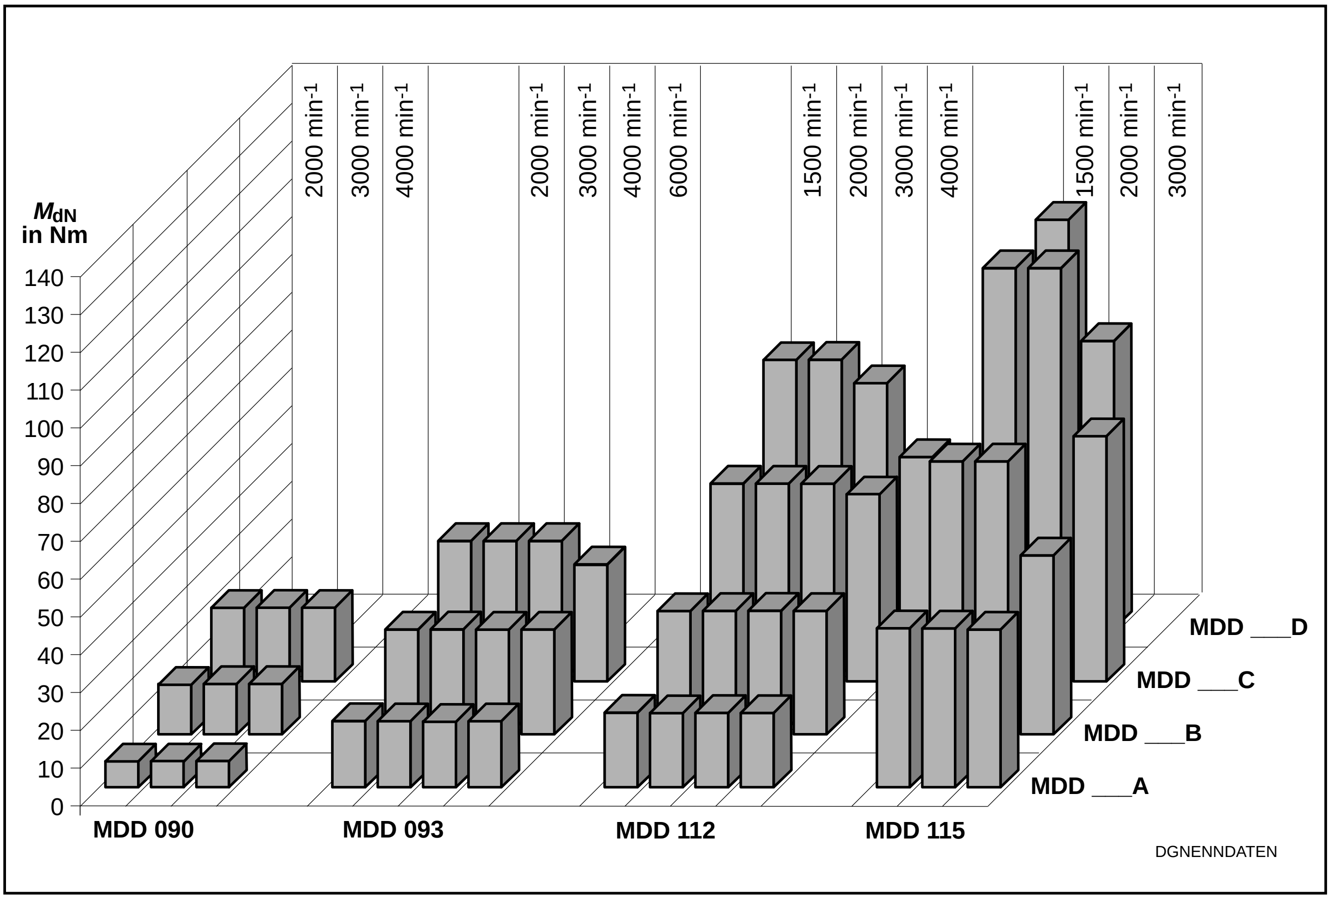

Figure 1.1: A performance overview

Construction

The liquid-cooled digital MDD AC servo motors are permanent magnet-excited motors with electronic commutation. The permanent magnets of the rotor are made up of magnetic materials which make it possible to construct a motor with low intertia.

The motors are equipped with a motor feedback, for position and speed evaluation and rotor position recognition, especially developed for this series.

Motor feedback

The motor feedback is available with either

- relative, or,
- absolute position evaluation.

The motor feedback has data storage capabilities for motor parameters storage. This means that the drive can be operated without damaging the motor.

Operating reliability

- A brushless design and lifetime lubricated bearings mean maintenance-free operation.
- The motor can be used directly within the working area of the machine even under poor environmental conditions (e.g., affects of coolants, oil emulsions). This is possible because both the motor and the connections for the motor power and feedback cables are totally sealed (as per protection category IP 65).
- Motor temperature monitoring by means of a temperature sensor built into the motor windings prevents overload damage to the intelligent digital drive.

Performance data

- A favorable torque-inertia ratio means high precision.
- The motor has high overload capabilities due to efficient heat conduction from the stator windngs to the outside wall of the motor housing.
- Peak torque is utilized over a wide speed range.
- A high power to weight ratio because of the compact construction.
- High cyclic load capacity permits continuous start-stop operations with high repetition rates. This is due to the electronic commutation of the motor.
- The sinusoidal application of current with high motor feedback resolution means high synchronizing characteristics.

Easy mounting to the machine

- Direct attachment of pinions and belt pulleys to the shaft because the design makes it possible to apply high radial loads.
- There is a defined load assimilation of outside forces at the motor shaft. This means that the floating bearing of side A of the motor absorbs the radial forces, while the fixed bearing of side B absorbs the axial forces.
- Thermal deformations in the motor affect side A.
- The motor can be installed in any orientation.
- Flange design with drill holes permits mounting as per design IMB5, or as per design IMB14 with windings in the flange.
- A wide variety of ready-made cables is available eliminating additional installation work.

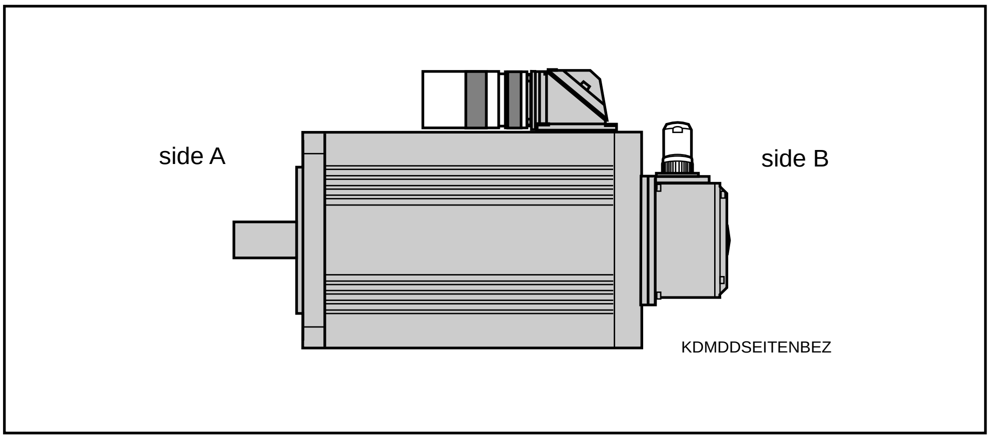

Figure 1.2: Labelling the sides of an MDD servo motor

2. General technical information

2.1. Environmental conditions

Installation altitude, ambient temperature

The power ratings listed in the selection guides are achieved under the following conditions:

- ambient temperature: +5 to +45 °C
- installation altitude: 0 to 1000 meters above sea level

There is a drop in the power ratings as outlined in the diagram in Figure 2.1 under conditions other than those listed. If the ambient temperature and installation altitude both deviate simultaneously, than it is necessary to multiply both power factors.

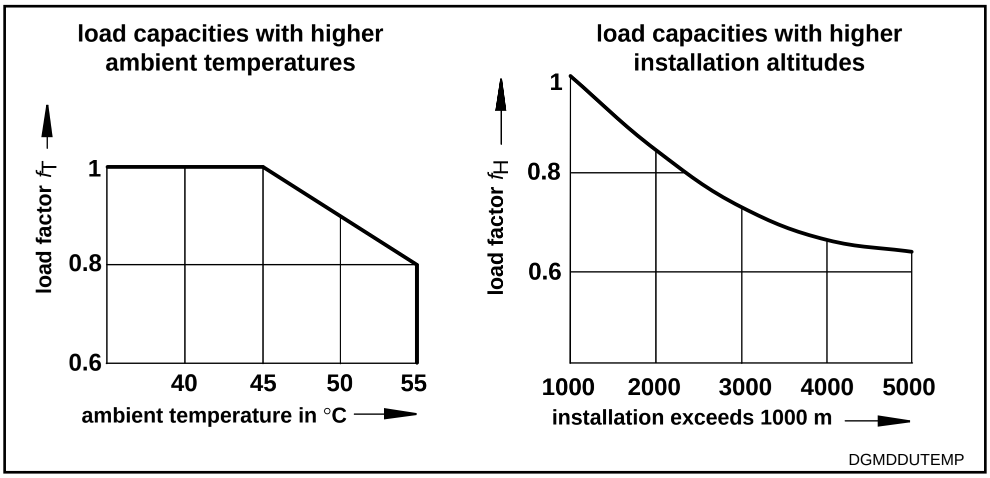

Figure 2.1: Load capacities with higher ambient temperatures and greater altitudes

Protection category

Liquid-cooled MDD servo motors are protected by their housing and covers as per DIN VDE 0470, section 1 (edition dated 11/92) against:

- contact with live or moving parts
- penetration by objects and water

The protection categories are indicated in terms of the letters IP (**I**nternational **P**rotection) and two digits for the grade of protection. The category for liquid-cooled MDD servo motors is IP65:

- for the housing,
- the drive shaft, and,
- the power and feedback connections.

The first digit defines the protection level against contact and penetration. The digit 6 means:

- protection against penetration by dust (dust-proof), and,
- complete protection against contact.

The second digit defines the protection level against water. The digit 5 means:

- protection against a jet of water, coming from all directions and directed at the housing through a nozzle (a jet of water).

2.2. Motor feedback

Digital MDD AC servo motors are available with two different motor feedbacks:

- either digital servo feedback, or,
- digital servo feedback with integrated multiturn absolute encoder.

The dimensions of both are identical.

Motor feedback data

Designation	Data
measuring principle	optical system
position resolution on the motor	$256 \times 2^{13} = 2\,097\,512$ increments/revolutions
system accuracy	±0.5 angular minutes
evaluation range with absolute position evaluation	4096 RPMs of the motor

Figure 2.2: DSF motor feedback data

Digital servo feedback (DSF)

This version permits a **relative indirect evaluation of position** on the motor. The relative position is stored in the intelligent digital drive controller. It can be handed over to the NC master control. This eliminates the need for a separate incremental encoder on the motor. The absolute position of the axis is lost when power is shut down. Powering up requires renewed homing.

This version is also used with a **relative direct evaluation of position** on the machine.

Digital servo feedback (DSF) with integrated multiturn absolute encoder (MTG)

This version permits an **absolute indirect evaluation of position** on the motor. The absolute position is stored in the intelligent digital drive and can be handed over to the NC master control. This eliminates the need for a separate absolute encoder on the motor. The absolute position of the axis is maintained when power is shut off.

This version is also used with a **relative direct evaluation of position** on the machine, combined with an absolute position evaluation on the motor.

2.3. Mechanical features

Output direction of the power connection

The output direction of the power connection can be selected in terms of the application, in other words, in accordance with the conditions at the machine. The following variations are available:

- connector towards side A
- connector towards side B
- connector to the right (view from the front onto the motor shaft, connecting housing on top)
- connector to the left (view from the front onto the motor shaft, connecting housing on top)

Centering diameters

The following diameters are available to increase compatibility with the motors of other manufacturers:

For the MDD 112 and 115

- ø 130 mm (standard)
- ø 180 mm

For the MDD 090 and 093

- ø 110 mm (standard)
- ø 130 mm

Output shaft

Plain output shaft (standard)

This achieves a torque transmission free of backlash with a non-positive connection. Clamping sets, pressure sleeves or similar clamping components can be used for coupling in pinions, belt pulleys or similar elements.

We recommend the use of plain shafts with friction-locked connections.

Output shaft with keyway per DIN 6885, sheet 1 (edition dated 8/68)

This achieves a form-fitting torque transmission. This type of shaft-hub connection is suitable for lesser demands. Multi-axial stress occurs at the shaft-hub connection due to torsion, bending, radial and axial loads. During powerful reverse operations, the bottom of the key can turn out and reduce the quality of concentricity. Ever-increasing deformations can cause fractures.

Radial shaft load

The radial shaft load as relates to

- average speed
- and point of application of force

is depicted in section 3. Bearing lifespan was based on 30,000 working hours (calculations per ISO 281, edition dated 12/90).

Axial shaft load

The axial shaft load is outlined in section 3.

Thermal deformations affect side A of the motor. This means that the A side of the motor shaft end can shift up to 0.6 mm with respect to the motor housing. As a result there is a shifting of position

- **of drive pinions with helical teeth mounted to the motor output shaft but not axially fixed to the machine, or,**
- **of drive pinions with helical teeth axially fixed to the machine with bevel gear pinions on which thermal stress can occur. The latter can lead to damage on side B of the motor.**

Holding brake

The motors are available with holding brakes for a backlash-free holding off of the servo axis when no voltage is being applied. The holding brakes developed for this motor series operate on the closed-circuit current principle. At zero current, a magnetic force acts on the brake armature disc. This means that the brake is locked and holding off the axis. With the application of 24V DC, the electrical field cancels the permanent magnetic field and the brake opens.

The holding brake is available with different torques depending upon the type of motor (see technical data).

The digital, intelligent drive controls the holding brake. This maintains the on and off sequence in all operating states. Current measurements in the drive monitor the release of the holding brake. The moment of clamping of an E-stop or fault situation can be selected via parameters to suit the application:

- for example, either immediate clamping,
- clamping after speed falls below 10 min^{-1} , or,
  clamping after 400 ms -- even if speed exceeds 10 min^{-1}.

The holding brake is not a working brake. It wears down after approximately 20,000 revolutions against the closed brake.

DDS intelligent digital drives with ANALOG interface achieve a drift-free standstill of the drive via a switching signal. The drive-internal speed control holds the standstill position at zero without drift as long as the drives are active.

Balance class

It is possible to select the balance class for various motor applications in accordance with DIN ISO 2373.

- class N (standard):
  - for normal applications
- class R:
  - for more demanding applications, e.g., grinding machines, or
  - servo drives in main drive applications, e.g., drive tools on lathes.

These classes apply to an A side of a motor shaft without attachments.

2.4. Electrical features

Terminal diagram (schematic)

The terminal diagram depicted in Figure 2.3 is a schematic representation. It is the checklist for all electrical connections required to operate a liquid-cooled MDD servo motor.

INDRAMAT MDD servomotors have standard electrical connections. This restricts the variety of conductors. Sections 4 and 5 list the electrical connections for all specific applications.

The following electrical connections are on the main spindle motor:

- power supply for temperature sensor and holding brake, and,
- motor feedback connection.

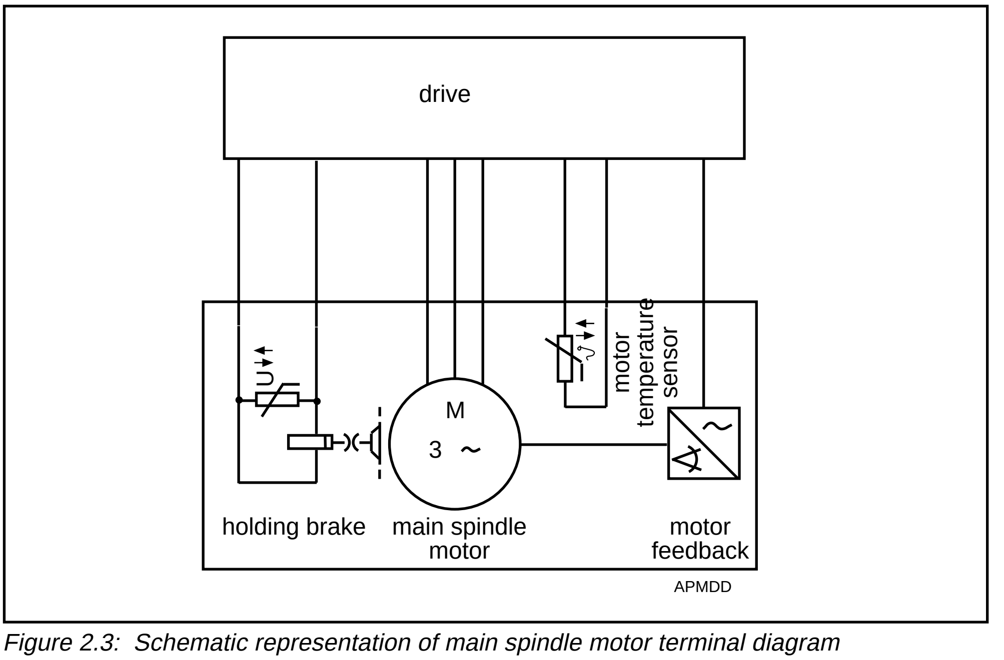

Figure 2.3: Schematic representation of main spindle motor terminal diagram

Motor power connector

Motor power connectors are available for the electrical power connections for:

- crimping, or,
- soldering.

Motor power cables with metric cross sections can be either crimped or soldered to the power connector. Those with inch cross sections can only be soldered.

Feedback connector

Straight or elbow connectors are available to connect the motor feedback, depending upon installation requirements.

Elbow connector

The elbow connectors are manufactured at the plant so that the cable output direction is the B side of the motor.

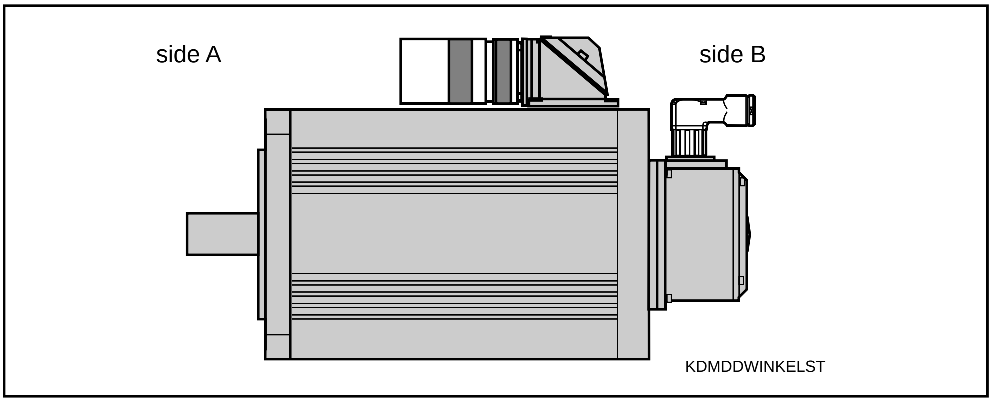

Figure 2.4: Standard cable output direction if elbow connectors are used

The plug connector with screw cap can be turned in increments of 90° once the four fixing screws of the connector housing are released.

Do not damage the seal and cable strands when tightening the screws.

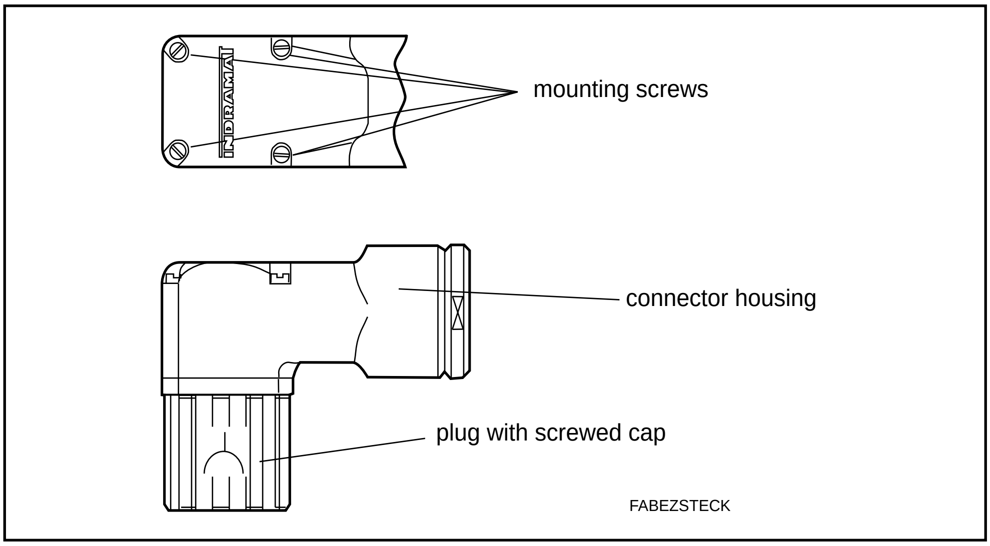

Figure 2.5: Identifying the individual parts of the connectors

2.5. Torque-speed characteristics curves

These curves depict

- the torque limiting values,
- the speed limiting values, and,
- the operating characteristics curves of each motor type.

Torque limiting values

The horizontal line, M_{max}, describes the theoretically possible maximum torque of the motor. The drive can limit this maximum torque. The maximum torque resulting from the various motor-drive combinations is outlined in the selection guides.

Speed limiting values

Maximum motor speed is determined by the DC bus voltage produced by the power source on the drive.

Depending upon the DC bus voltage on the drive, maximum torque drops at a breaking point. These dropping curves are allocated as follows:

- [1] - DC bus voltage with a regulated power supply (e.g., KDV 4, TVD, KVR, TVR), or an unregulated power supply (e.g., TVM2, KDV 1, KDV 2, KDV 3, DKS), if AC mains input voltage is 10% higher than the rated 3 x 230 V AC.
- [2] - DC bus voltage with an unregulated power supply (e.g., TVM 2 KDV 1, KDV 2, KDV 3, DKS) connected to threephase mains rated at 3 x 230 V.
- [3] - DC bus voltage with an unregulated power supply (e.g., TVM 2, KDV 1, KDV 2, KDV 3, DKS), if the AC mains input voltage is 10% less than the rated 3 x 230 V AC.
- [4] - DC bus voltage with an unregulated power supply (e.g., DKS), if AC mains input voltage is connected to a single phase mains rated at 1 x 230 V AC.
- [5] - DC bus voltage with an unregulated supply (e.g., DKS), if the AC mains input voltage is 10% less than the rated 1 x 230 V AC.

Operating curves

The operating characteristics curves depict the permissible continuous torque of the liquid-cooled motor (S1 operating mode per DIN 57530/VDE 0530).

Application

The speed-torque characteristics curves can be used:

- to record information from the selection documentation,
- to determine the possible maximum usable speed for a special application with known torque requirements,
- and to check whether the application remains within the thermal limits of the motor. The root-mean-square torque for a critical cycle must be below the S1-continuous operating characteristic curve of the arithmetically averaged speed.

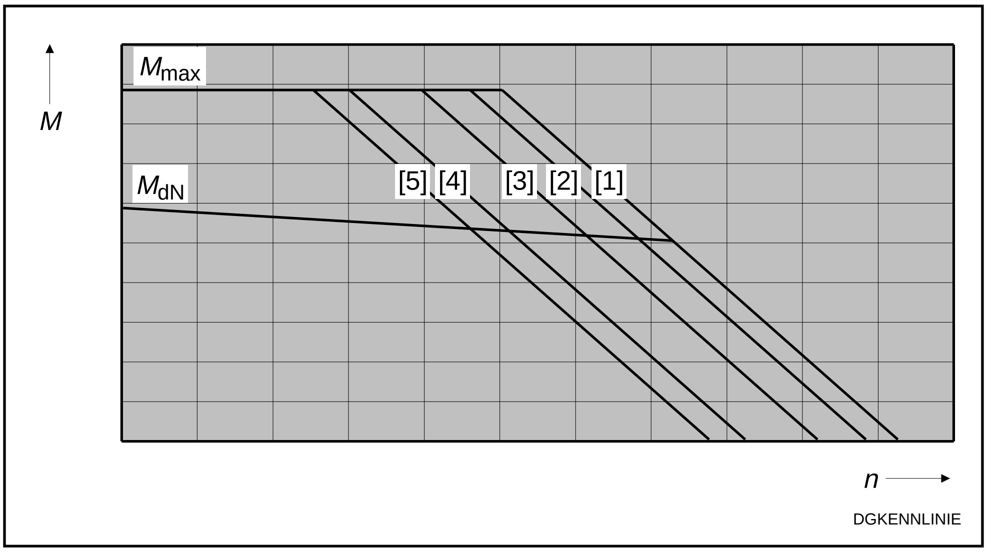

Figure 2.6: Schematic diagram of the torque-speed characteristics curves

3. Technical data

3.1. MDD 090 (liquid-cooled)

3.1.1. MDD 090 motor data

3.1.5. MDD 090 - type codes

Type code fields

Example: M D D 0 9 0 B - F - 0 2 0 - N 2 L - 1 1 0 G B 0 / S 0 0 0

1.	Name	
	Motor for digital drives	MDD
2.	Motor size	090
3.	Motor length	A, B, C
4.	Housing:	
	for liquid-cooling	F
5.	Basic speed	
	2000 min $^{-1}$	020
	3000 min $^{-1}$	030
	4000 min $^{-1}$	040
6.	Balance class	
	N per DIN ISO 2373	N
	R per DIN ISO 2373	R
7.	shaft end on side B	
	standard (no second shaft end)	2
8.	Motor feedback	
	digital servo feedback	L
	digital servo feedback with integrated multiturn encoder	M
9.	Centering diameter	
	ø110 mm	110
	ø130 mm	130
10.	Output shaft	
	plain shaft	G
	shaft with keyway per DIN 6885, sheet 1	P
11.	Output direction of the power connection	
	connector towards side A	A
	connector towards side B	B
	connector to the right (view from front onto motor shaft, connector housing on top)	R
	connector to the left (view from front onto motor shaft, connector housing on top)	L
12.	Holding brake	
	no holding brake	0
	with holding brake of 6.5 Nm	1
	with holding brake of 11.0 Nm	2
13.	Custom versions	
	Determined and documented by INDRAMAT with custom number. Type key field 13 does not apply to standard motors.	

Figure 3.11: MDD 090 (liquid-cooled) - available options

3.2. MDD 093 (liquid-cooled)

3.2.1. MDD 093 - motor data

Designation	Symbol	Unit				
Motor type MDD . . .			**093A-F-020**	**093A-F-030**	**093A-F-040**	**093A-F-060**
Basic motor speed [1]	n	min^{-1}	2000	3000	4000	6000
Continuous stall torque	M_{dN}	Nm	17.5	17.5	17.5	17.5
Continuous stall current	I_{dN}	A	19.3	33.7	44.3	70.0
Theor. maximum speed [2]	M_{max}	Nm	28.5	28.7	28.2	28.6
Peak current	I_{max}	A	45.8	79.9	104.8	165.8
Rotor inertia [3]	J_M	kgm^2	0.0022	0.0022	0.0022	0.0022
Torque constant at 20 °C	K_m	Nm/A	0.90	0.52	0.39	0.25
Windings resistance at 20 °C	R_A	Ohm	1.86	0.61	0.38	0.16
Windings inductance	L_A	mH	15.3	4.9	2.8	1.9
Thermal time constant	T_{th}	min	25	25	25	25
Mass [3]	m_M	kg	13	13	13	13
Rated power loss	P_{vN}	W	730			
Ambient temperature [4]	ϑ_{amb}	°C	+5 to +45			
Coolant entry temperature	ϑ_{ein}	°C	+10 to +40			
Coolant temperature increase with P_{vN}	$\Delta\vartheta_N$	°C	10			
Minimum coolant flow through with $\Delta\vartheta_N$ [5]	Q_N	l/min	1.0			
Pressure drop with Q_N [5] [6]	Δp_N	bar	0.5			
Maximum system pressure	p_{max}	bar	3			
Volume in coolant canal	V	l				
Storage and transportation temperature [7]	ϑ_L	°C	-20° to +80°			
Maximum installation altitude		m	1000 meters above sea level			
Protection category			IP 65			
Insulation classification			F			
Housing finish			prime coat black (RAL 9005)			
<u>options</u> <u>holding brake, electrical release</u>						
Holding torque	M_H	Nm	11		22	
Rated voltage	U_N	V	24 ± 10%		24 ± 10%	
Rated current	I_N	A	0,5		0.69	
Inertia	J_B	kgm^2	1.06×10^{-4}		3.6×10^{-4}	
Release delay	t_L	ms	60		70	
Clamping delay	t_K	ms	20		30	
Mass	m_B	kg	0.5		1.1	

1) Usable motor speed is determined by the torque requirements of the application. The usable speeds n_{max} found in the selection lists of the motor-drive combinations are binding for standard applications. The usable speeds for other applications can be found using the required torque in the torque-speed characteristics curves.
2) The maximum achievable torque depends upon the drive used. **Only** those maximum torques M_{max} found in the selection list of the motor-drive combinations are binding.
3) Without holding brake.
4) Note the relationship between the actual ϑ_{amb} and the ϑ_{ein}: ϑ_{ein} may be no more than 5 °C below ϑ_{amb}!
5) With coolant water.
6) Note flow diagram for deviating flow values.
7) Empty of all coolant prior to transportation or storage.

3.2.3. MDD 093 - shaft load

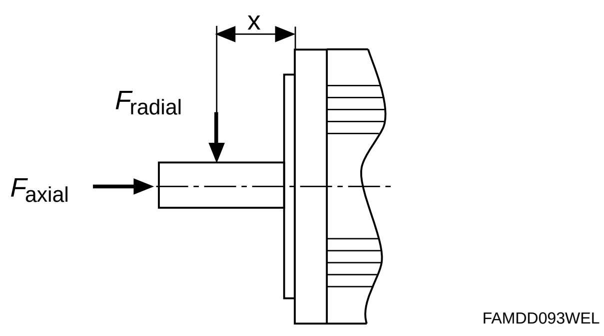

Figure 3.22: Shaft load

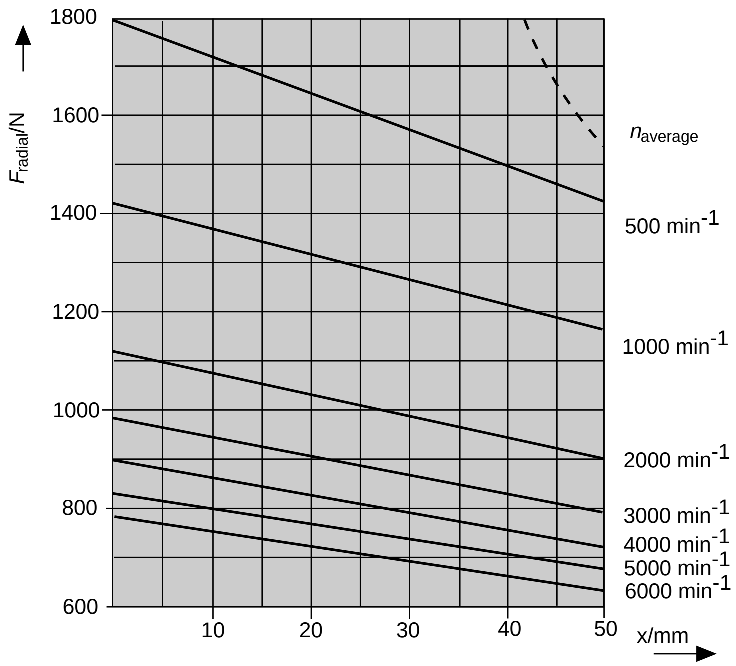
Radial force F_{radial}



F_{radial} - radial force as a function of distance, x, and average speed, $n_{average}$

—— output shaft without keyway

– – limit with output shaft with keyway as per DIN 6885, sh.1

x - distance x

$n_{average}$ - average servo motor speed (arithmetically determined)

Calculations based on:
30 000 operating hours as nominal bearing lifespan L_{10h}

For higher radial loads, F_{load}, bearing lifespan is reduced as follows:

$L_{10h} = (F_{radial} / F_{load})^3 \cdot 30{,}000$ hrs.

DGMDD093RAD

Figure 3.23: Radial force

Axial force F_{axial}

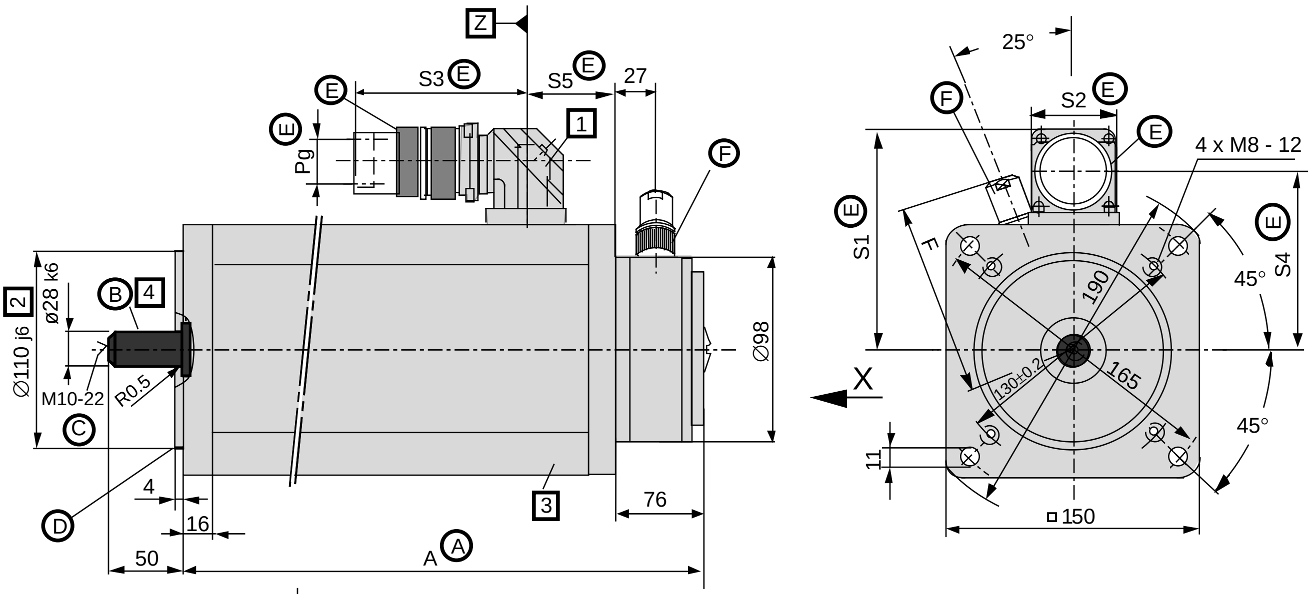
$$F_{axial} = 0.34 \cdot F_{radial}$$

F_{axial} - permissible axial force

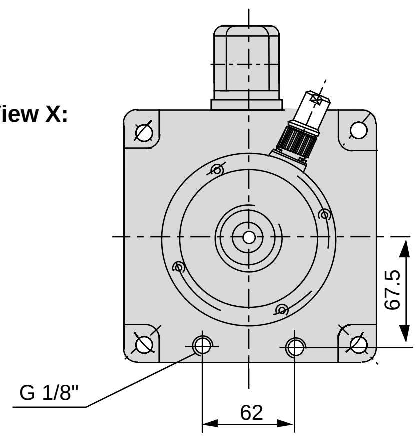
F_{radial} - permissible radial force

3.2.4. MDD 093 - dimensional data

General dimensions:



View X:



Ⓐ **Table:**

Size	Dim. A 1)
MDD 093 A	286
MDD 093 B	327
MDD 093 C	386
MDD 093 D	436

1) Larger with some options. The applicable dimensions are given with the option.

Ⓑ Position accuracy as per tolerance R DIN 42 955

Ⓒ center drill hole DS M10 per DIN 332, sh. 2

Ⓓ Flange type determines mounting mode
- as per design B5 (drill hole in flange)
- as per design B14 (windings in flange)

Ⓔ **Motor power connector:**
Depends on motor, not delivered with motor.

Table:

Maß / Typ	S1	S2	S3	S4	S5	Pg
INS 108 2)	130	45	110	110	49	21
INS 172	137	52	145	112	55,5	36

2) for MDD 093 A - F - 020,
MDD 093 B - F - 020,
MDD 093 A - F - 030,

Ⓕ **Feedback connector:**
Not delivered with motor.

Table:

Name	Connector	Dim. F
straight	INS 513	110
	INS 512	112
elbow	INS 511 INS 510	108

MBMDD093A

Figure 3.24: General data on MDD 093 (liquid-cooled)

Options-dependent dimensions:

1 **Mounting direction of motor power connector:**

- to side A
- to side B
- to the right } looking towards motor shaft
- to the left }

Side A is depicted as the output direction in the drawing. The dimensions of other output directions can be obtained by turning the housing around the Z axis.

2 **Custom centering diameter:**

- Ø130 j6

3 **Holding brake:**

- Holding torque of 11 Nm
- Holding torque of 22 Nm

Table for holding torque of 11 Nm
does not affect outer dimensions

Table for holding torque of 22 Nm	
Size	Dim. A
MDD 093 A	316
MDD 093 B	357
MDD 093 C	416
MDD 093 D	466

4 **Output shaft:**

- plain shaft (preferred type)
- with keyway as per DIN 6885, sh. 1 (Note: balanced with entire key!)

matching key: DIN 6885-A 8x7x40

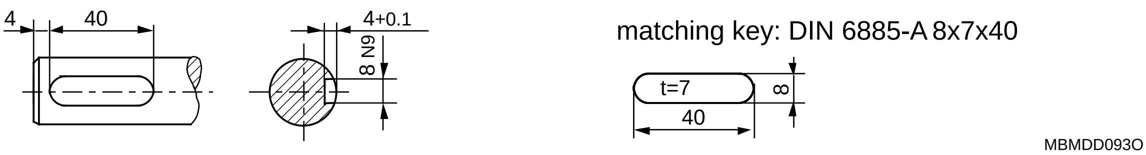


Figure 3.25: Options-dependent dimensions for MDD 093 (liquid-cooled)

3.2.5. MDD 093 - type codes

Type codes:

3.3.3 MDD 112 - shaft load

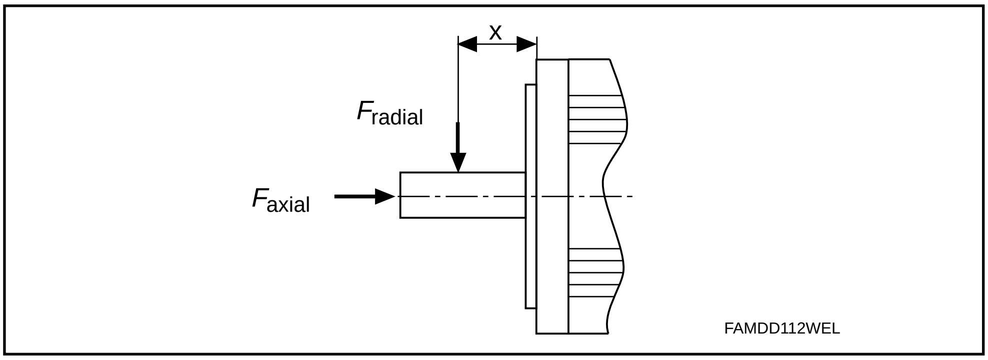

Figure 3.37: Shaft load

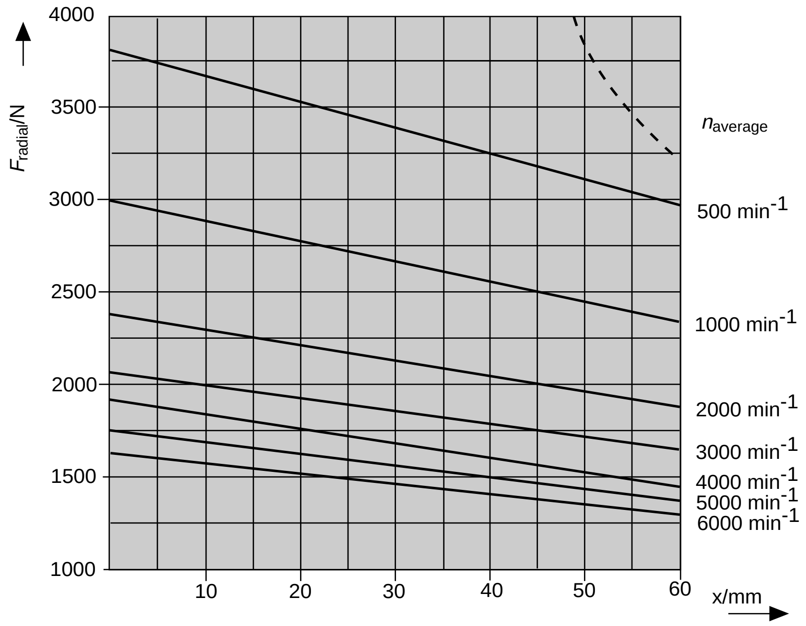
Radial force F_{radial}



F*radial* - radial force as a function of distance, x, and average speed, n*average*

—— output shaft without keyway

– – limit with output shaft with keyway as per DIN 6885, sh.1

x - distance x

n*average* - average servo motor speed (arithmetically determined)

Calculations based on:
30 000 operating hours as nominal bearing lifespan L10h

DGMDD112RAD

For higher radial loads, F*load*, bearing lifespan is reduced as follows:

L10h = (F*radial* /F*load*)3 • 30,000 hrs.

Figure 3.38: Radial force

Axial force F_{axial}

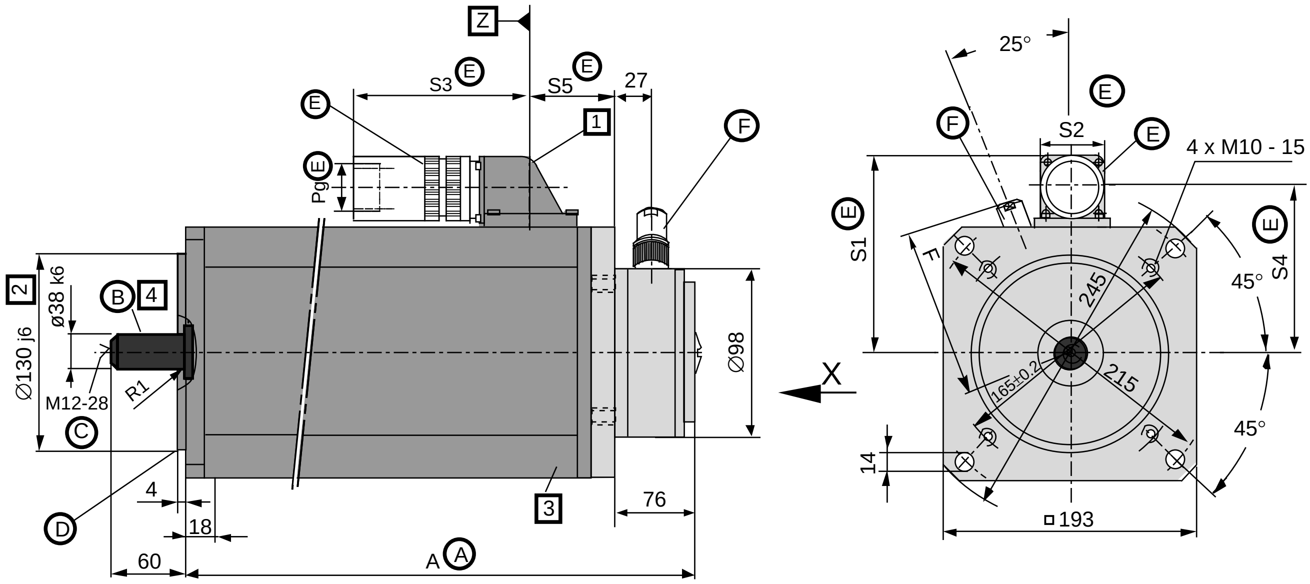
$$F_{axial} = 0.35 \cdot F_{radial}$$

F_{axial} - permissible axial force

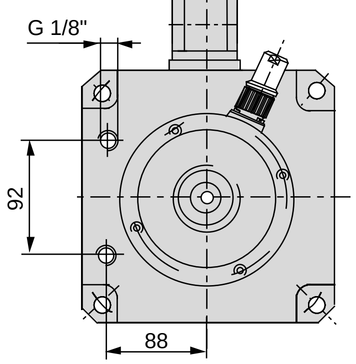
F_{radial} - permissible radial force

3.3.4. MDD 112 - dimensional data

General dimensions:



View X:



Ⓐ **Table:**

Size	Dim.A 1)
MDD 112 A	312
MDD 112 B	387
MDD 112 C	462
MDD 112 D	537

1) Larger with some options.
The applicable dimension
is given with the option.

Ⓑ position accuracy per tolerance R DIN 42 955

Ⓒ center drill hole DS M12 per DIN 332 sh. 2

Ⓓ flange determines mounting mode
- per design B5
(drill hole in flange)
- per design B14
(windings in flange)

Ⓔ **Motor power connector:**
Depends on motor, not
delivered with motor.

Table:

Dim. / Type	S1	S2	S3	S4	S5 1)	Pg
INS 108 2)	151	45	110	133	56	21
INS 172	160	52	145	137	62,5	36

2) for MDD 112 A - F - 015
MDD 112 B - F - 015
MDD 112 A - F - 020
MDD 112 A - F - 030

Ⓕ **Feedback connector:**
Not delivered with motor

Table:

Name	Connector	Dim. F
straight	INS 513	110
	INS 512	112
elbow	INS 511 INS 510	108

MBMDD112A

Figure 3.39: General data on MDD 112 (liquid-cooled)

Option-dependent dimensions:

1 **Mounting direction of motor power cable:**

- to side A
- to side B
- to the right } looking towards motor shaft
- to the left }

The output direction depicted is side A. The dimensions for other output directions can be obtained by turning the housing around the Z axis.

2 **Custom diameter:**

- Ø180j6

3 **Holding brake:**

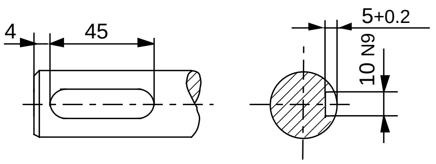
- holding brake of 14 Nm
- holding brake of 40 Nm
- holding brake of 60 Nm

Table for 14Nm holding brake
does not affect outer dimensions

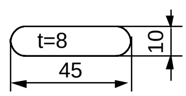
Table for 40 and 60 Nm holding brake		Connector	
		INS 108	INS 172
Size	Dim. A	S5	S5
MDD 112 B	437	99	105.5
MDD 112 C	512		
MDD 112 D	587		

4 **Output shaft:**

- plain shaft (preferred type)
- with keyway per DIN 6885 sh. 1 (Note: balanced with entire key!)



matching key: DIN 6885-A 10x8x45



MBMDD112O

Figure 3.40: Options-dependent dimensions for MDD 112 (liquid-cooled)

3.3.5. MDD 112 - type codes

Type codes: Example: MDD112B-F-020-N2L-130GB0/S000

1. Designation
   Motor for digital drives — MDD

2. Motor size — 112

3. Motor length — A, B, C, D

4. Housing:
   for liquid-cooling — F

5. Rated speed

1500 min $^{-1}$	015
2000 min $^{-1}$	020
3000 min $^{-1}$	030
4000 min $^{-1}$	040

6. Balance class

N per DIN ISO 2373	N
R per DIN ISO 2373	R

7. Shaft end on side B
   standard (without second shaft end) — 2

8. Motor feedback

digital servo feedback	L
digital servo feedback with integrated multiturn encoder	M

9. Centering diameter

ø130 mm	130
ø180 mm	180

10. Output shaft

plain shaft	G
shaft with keyway per DIN 6885 Sh. 1	P

11. Output direction of power connection

To side A	
To side B	
To the right (looking towards shaft, housing on top)	R
To the left (looking towards shaft, housing on top)	L

12. Holding brake

no holding brake	0
with holding brake 14.0 Nm	1
with holding brake 40.0 Nm	2 [1)]
with holding brake 60.0 Nm	3 [1)]

13. Custom version
    Determined and documented by Indramat with custom number.
    Field 13 does not apply to standard motors

[1)] Not with MDD 112A

Figure 3.41: Options for MDD 112 (liquid-cooled)

Rated current	I_N	A	0.96	1.35
Inertia	J_B	kgm^2	9.5×10^{-4}	32×10^{-4}
Release delay	t_L	ms	55	150
Clamping delay	t_K	ms	18	30
Mass	m_B	kg	1.9	3.5

) Usable motor speed is determined by the torque requirements of the application. The usable speeds n_{max} found in the selection lists of the motor-drive combinations are binding for standard applications. The usable speeds for other applications can be found using the required torque in the torque-speed characteristics curves.

2) The maximum achievable torque depends upon the drive used. **Only** those maximum torques M_{max} found in the selection list of the motor-drive combinations are binding.

3) Without holding brake.

4) Note the relationship between the actual ϑ_{amb} and the ϑ_{ein}: ϑ_{ein} may be no more than 5 °C below ϑ_{amb}!

5) With coolant water.

6) Note flow diagram for deviating flow values.

7) Empty of all coolant prior to transportation or storage.

3.4.3. MDD 115 - shaft load

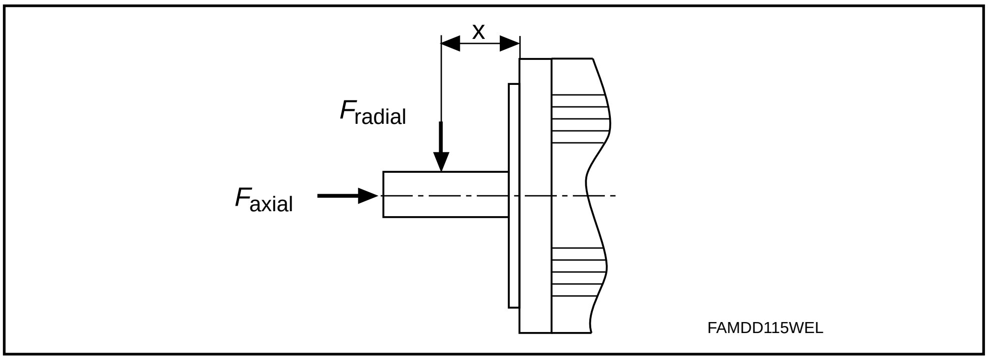

Figure 3.50: Shaft load

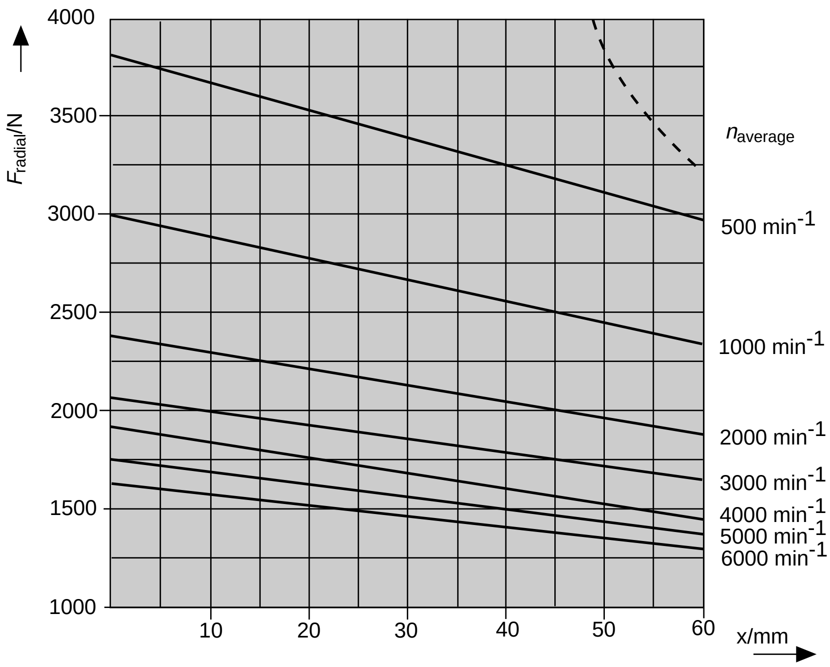
Radial force F_{radial}



F_{radial} - radial force as a function of distance, x, and average speed, $n_{average}$

— output shaft without keyway

– – limit with output shaft with keyway per DIN 6885, sh.1

x - distance x

$n_{average}$ - average servo motor speed (arithmetically determined)

Calculations based on:
30 000 operating hours as nominal bearing lifespan L_{10h}

Bearing lifespan drops with higher radial loads, F_{load}, as follows:

$L_{10h} = (F_{radial} / F_{load})^3 \cdot 30{,}000$ hrs.

DGMDD115RAD

Figure 3.51: Radial force

Axial force F_{axial}

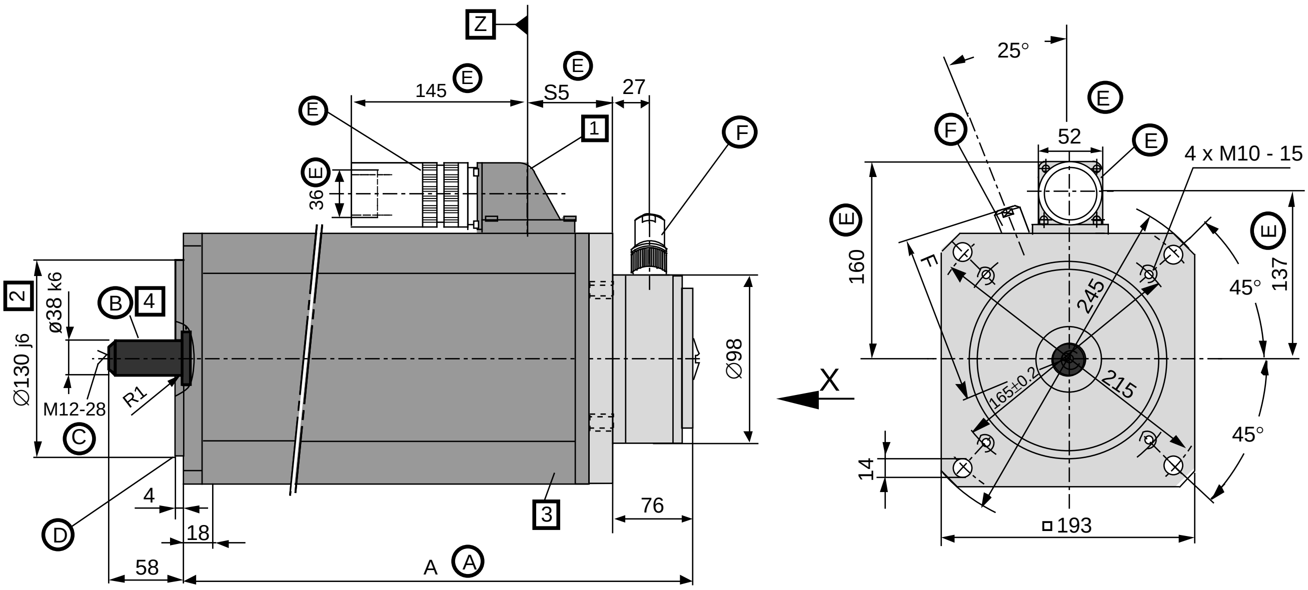
$$F_{axial} = 0.35 \cdot F_{radial}$$

F_{axial} - permissible axial force

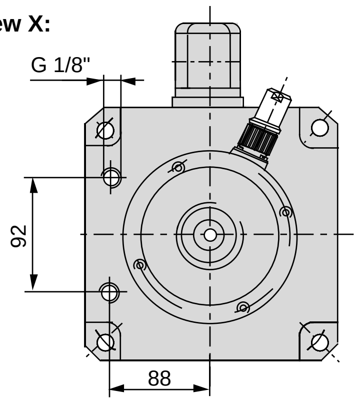
F_{radial} - permissible radial force

3.4.4. Maßangaben MDD 115

General dimensions:



View X:



Ⓐ **Table:**

Size	Dim.A 1)
MDD 115 A	359
MDD 115 B	409
MDD 115 C	459
MDD 115 D	509

1) Larger with some options. The applicable dimension is given with the option.

Ⓑ position accuracy per tolerance R DIN 42 955

Ⓒ center drill hole DS M12 per DIN 332, sh. 2

Ⓓ Flange determines mounting mode
- per design B5 (drill hole in flange)
- per design B14 (windings in flange)

Ⓔ **Motor power connector:**
Not supplied with motor.

[1] For monitoring of holding brake and temperature

[2] Working life equals more than 500,000 bending loads

Figure 4.5: Type-dependent data of the motor power connection

General information

Protection category	cable to connector transition IP 65
chemical characteristics	absolute resistance to mineral oils and greases, hydrolysis resistance, silicone and halogen free
permissible ambient temperature for operation and storages	from -30 °C to +80 °C
cable surface	does not adhere, prevents sticking in drag chains
cable length	maximum 75 meters

Figure 4.6: General data on the motor power cables

Ordering guidelines

Example: IKL 001 / 12.0

- 12.0 — Length in meters
- L — L…standard cable with shield
  F…flexible cable without shield (not available in diameters 0.75 and 1.5 mm$^{2)}$
  G…cable with shield

(Available in increments of 0.5 meters after a length of five meters. Smaller lengths available upon request.)

5. Electrical motor feedback connection

5.1. Terminal diagram

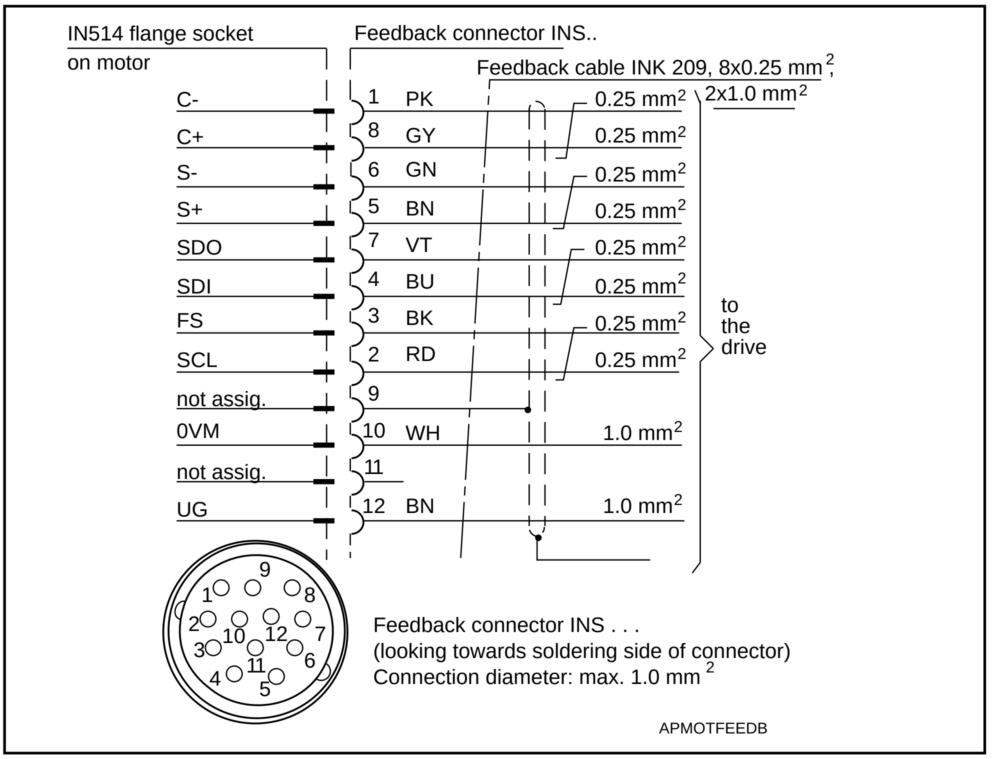

Figure 5.1: Terminal diagram

If own cables are used, then execute connecting cores per Figure 5.1. Improper execution could cause operational problems.

5.2. Feedback connector

Designation	connectors for INDRAMAT cable INK 209	connectors for all cables with outside diameter of 6 to 10 mm
connector (straight)	INS 513 	INS 512 connector (elbow)	INS 511 	INS 510 
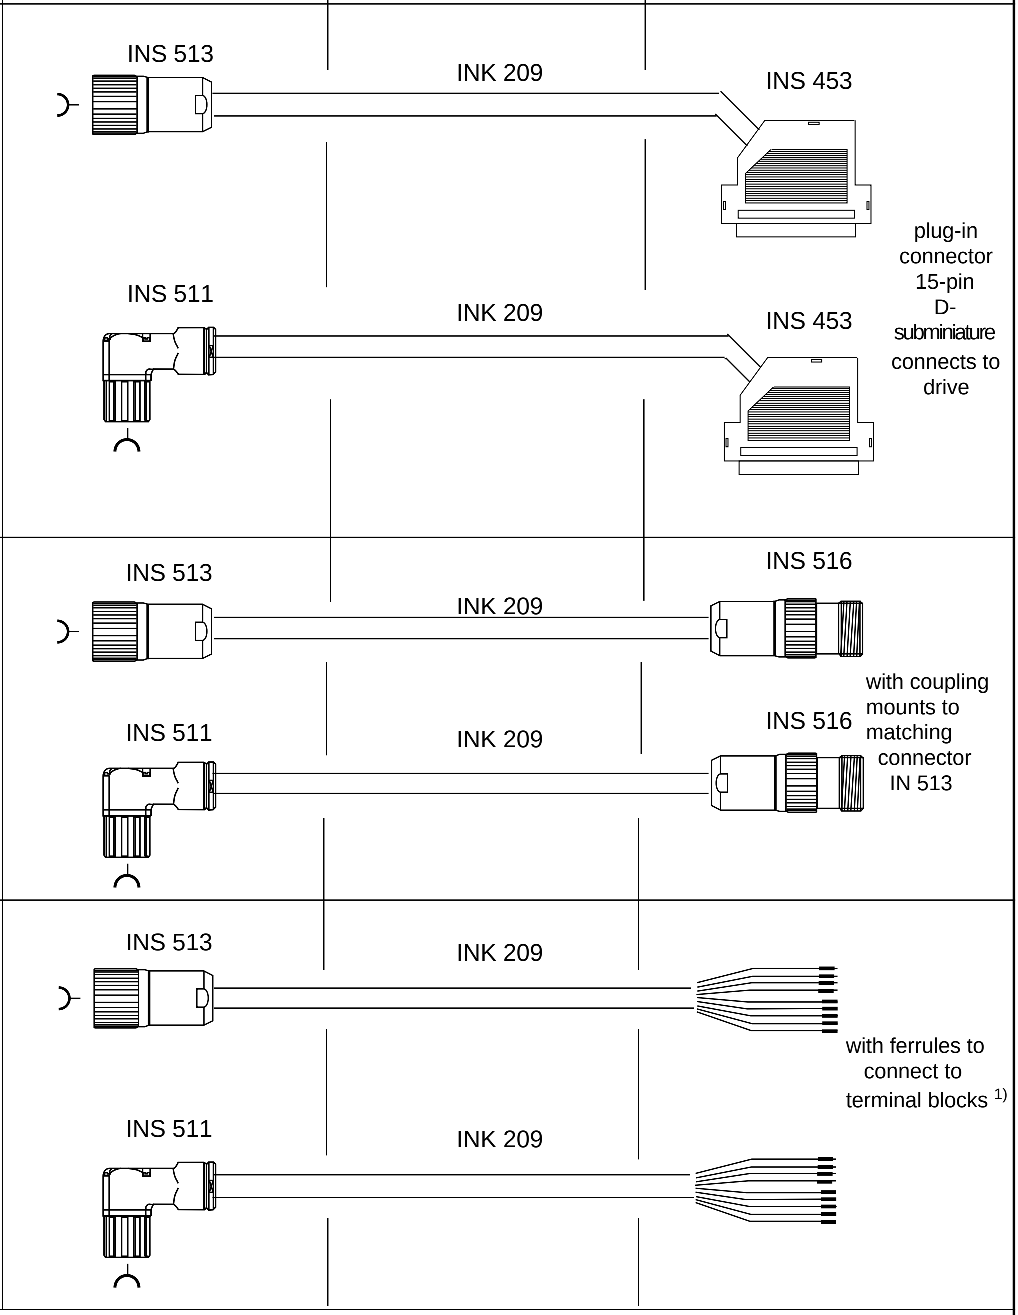
Figure 5.2: Feedback connector

5.3. Feedback cable - technical data

type designation	INK 209
cable-connector transition protection category	IP 65
cable diameter	8.8 mm
bending radius - fixed routing	40 mm
bending radius - flexible routing (lifespan greater than 500,000 bending loads)	90 mm
specific weight	0.102 kg/m
permissible ambient temperature for operating and storage	-30 °C to +80 °C
cable surface	does not adhere, prevents sticking in drag chains
maximum cable length	75 meters
chemical characteristics	absolute resistance to mineral oils and greases, hydrolysis resistant, silicone and halogen free

Figure 5.3: Technical data of feedback cable INK 209

5.4. Ready-made feedback cables



order designation for ready-made feedback cables	tyype designation for feedback connectors	INDRAMAT feedback cable	cable end
IKS 374 /...	INS 513	INK 209	INS 453
IKS 375 /...	INS 511	INK 209	INS 453 plug-in connector 15-pin D-subminiature connects to drive
IKS 376 /...	INS 513	INK 209	INS 516
IKS 377 /...	INS 511	INK 209	INS 516 with coupling mounts to matching connector IN 513
IKS 378 /...	INS 513	INK 209	with ferrules to connect to terminal blocks 1)
IKS 379 /...	INS 511	INK 209	

1) To be avoided as could interfere with shield.

Figure 5.4: Ready-made feedback cables

Ordering guidelines

Exanple: IKS 374 / 12.0 — Length in meters

(Available in increments of 0.5 meters after five meter lengths. Shorter lengths available upon request.)

6. Coolant connections

The coolant connection can be executed as follows:

Connection type	Sketch
hose nozzle	motor / hose nozzle / hose / hose clip quick-coupler	motor / coupling with windings / coupling with threaded joint / hose clamp connection	motor / clamp connection with windings / hose  EKANSFL

Figure 6.1: Possible liquid-cooling connections

These parts cannot presently be obtained from INDRAMAT.

Coolant supply lines

The coolant supply systems can be made of either

- pipes, or,
- hoses.

There is a considerable degree of pressure loss in a pipe coolant supply system due to the re-routing points (e.g., 90° elbows) which unavoidably occur in such a system. We therefore recommend the use of a hose supply system.

When choosing a hose system, however, the pressure loss within the system must be taken into consideration. Thus, the inside diameter of the hose must equal at least 9mm and must narrow shortly before the point of connection to the motor in those cases where greater hose lengths are necessary.

Coolant

The data listed in the documentation relates to water as coolant.

Further information on additives or other coolants are listed in the documentation, "Liquid coolant of INDRAMAT drive components".

Pressure drop

A pressure drop under nominal conditions is given in the technical data. Should the flow of volume change

- because some other coolant is used, or,
- because regulating or adjusting devices are lacking,

then the pressure drop changes as depicted in the flow diagram.

Flow diagram

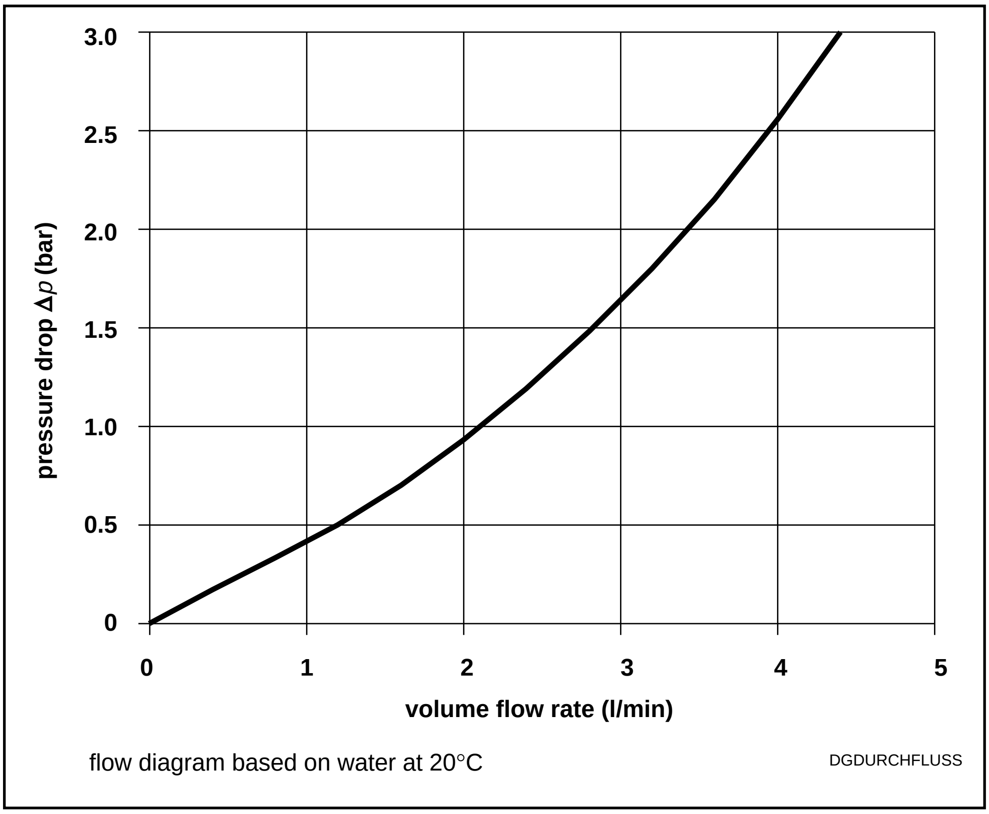

Figure 6.2: Flow diagram for an MDD servo motor

Supplementary information

Supplementary information on cooling systems can be found in the documentation entitled: "Liquid cooling of INDRAMAT drive components".
